

Assignment 1: Getting Started

Problems?

Do not hesitate to ask your teaching assistant at the practical meetings (or Jonas at the lectures) if you have any problems. You can also post a question in the assignment forum in Moodle.

Exercises

Lecture 1 (Getting Started)

1. Install Java

Download and install Java SE

JDK: www.oracle.com/technetwork/java/javase/downloads. Also, there are plenty of instruction videos available in YouTube. Just search for "Install Java X" where X is your operating system.

2. Install Eclipse

Download and install Eclipse IDE for Java

Developers: <http://www.eclipse.org/downloads/>. Once again, there are plenty of instruction videos available in YouTube. Just search for "Install Eclipse X" where X is your operating system.

3. Setup Eclipse Workspace

Before you start programming, do the following.

- Create an Eclipse *workspace* (a folder) with the name `java_courses` on some location in your home directory.
- Create a *Java project* with the name `1DV506` inside the workspace.
- Create a *package* with the name `YourLnuUserName_assign1` inside the project. For example, it might look something like `wo222ab_assign1`.
- Save all program files from the exercises in this assignment inside the package `YourLnuUserName_assign1`.
- In the future: create a new package (`YourLnuUserName_assignX`) for each assignment and a new project (with the course code as name) for each new course using Java.

4. Edit, compile and execute.

Create, compile and execute the following program inside your assignment 1 package:

```
5.
6.    /* The classical "Hello World!" program. */
7.    public class Hello {
8.
9.        public static void main(String[] args) {
10.            System.out.println("Hello World!"); // Print
11.        }
12.    }
```

Lecture 2 - (Input/Output, Operations on Primitive Types)

13. Printing

Write a program `Print.java`, which will print the phrase *Knowledge is power!*

- on one line,
- on three lines, one word on each line,
- inside a rectangle made up by the characters = and |.

14. Quote

Write a program `Quote.java` which reads a line of text (using class `Scanner`) and then prints the same line as a quote (that is inside " "). An example of an execution:

```
15.    Write a line of text:  I wish I was a punk rocker with flowers
    in my hair.
16.    Quote: "I wish I was a punk rocker with flowers in my hair."
```

17. Number of seconds

Write a program `Seconds.java` which reads three integers (hours, minutes, seconds) and then computes the corresponding time measured in seconds. For example, 1 hour, 28 minutes and 42 seconds is equal to 5322 seconds.

An example of an execution:

```
18.    Hours: 1
19.    Minutes: 28
20.    Seconds: 42
21.
22.    Total time measured in seconds: 5322
```

23. BMI

Write a program `BMI.java` which computes the BMI (Body Mass Index) for a person. The program will read length and weight from the keyboard and then present the result as output. The BMI is computed as $\text{weight}/(\text{length})^2$, where the length is given in meters and the weight in kilograms. An example of an execution:

```
24.    Give your length in meters: 1,83
```

```
25.      Give your weight in kilograms: 83
26.      Your BMI is: 25
```

Note: the BMI is always an integer.

27. Time

Write a program `Time.java`, which reads a number of seconds (an integer) and then prints the same amount of time given in hours, minutes and seconds. An example of an execution:

```
28.      Give a number of seconds: 9999
29.      This corresponds to: 2 hours, 46 minutes and 39 seconds.
```

Hint: Use integer division and the modulus (remainder) operator.

30. Sum of Three

Write a program `SumOfThree.java` which asks the user to provide a three digit number. The program should then compute the sum of the three digits. For example:

```
31.      Provide a three digit number: 483
32.      Sum of digits: 15
```

If Time Permits

Exercise 11 is marked as *VG task* ==> only mandatory for those of you that aspire for a higher mark (A or B).

33. Change (VG-task)

Write a program `Change.java` that computes the change a customer should receive when he has paid a certain sum. The program should exactly describe the minimum number of Swedish bills and coins that should be returned rounded off to nearest krona (kr). Example:

```
34. Price: 372.38
35. Payment: 1000
36.
37. Change: 628 kronor
38. 1000kr bills: 0
39. 500kr bills: 1
40. 100kr bills: 1
41. 50kr bills: 0
42. 20kr bills: 1
43. 10kr coins: 0
44. 5kr coins: 1
45. 1kr coins: 3
```

Lecture 3 - Using Library Classes

46. Fahrenheit to Celsius

Write a program `Convert.java`, which reads a temperature in Fahrenheit and then converts it to Celsius using the formula:

```
47.      C = (F-32) * 5/9
```

The result should be presented with a single decimal correctly rounded off.

48. Short Name

Write a program `ShortName.java`, reading a first name and a last name (given name and family name) as two Strings. The output should consist of the first letter of the first name followed by a dot and a space, followed by the first four letters of the last name. An example of an execution:

```
49.      First name: Anakin
50.      Last name: Skywalker
51.      Short name: A. Skyw
```

Hint: Use methods of the `String` class.

What will happen if the last name consists of less than four letters?

52. Random Number

Write a program `TelephoneNumber.java`, generating and printing a random telephone number of the form `0XXX-ZYYYYY`. The area code consists of a zero followed by three digits (X). The local number can not start with a zero (Z), all other digits (Y) are random.

Hint: Use the class `java.util.Random`.

53. Square Root

Write a program `Distance.java` which reads two coordinates in the form (x,y) and then computes the distance between the points, using the formula

```
54. distance = Sqrt( (x1-x2)^2 + (y1-y2)^2 )
```

`Sqrt()` means "the square root of" and `^` means "raised to". The answer should be presented with three decimal digits.

Hint: Use the class `java.lang.Math` for the computations.

If Time Permits

Exercise 16 is marked as *VG task* ==> only mandatory for those of you that aspire for a higher mark (A or B).

55. Wind Chill (VG-task)

Write a program `WindChill.java` that asks the user for a temperature (°C) and the wind speed (measured in m/s) and then computes the so-called *wind chill temperature* using [Siple's formula](#). For example:

```
56.      Temperature:  -7.8
57.      Wind speed:   8.4
58.
59.      Wind Chill Temperature: -24.5
```

Submission

Only exercises 5-16 should be handed in. (Notice that the VG exercises 11 and 16 are not mandatory.) We are only interested in your .java files. Hence, zip the directory named `YourLnuUserName_assign1` (inside directory named `src`) and submit it using the Moodle submission system.
